

SDN-NFV Infrastructure for Disaster Mitigation and Smart Cities

Yoshiyuki Kido

Cybermedia Center, Osaka University

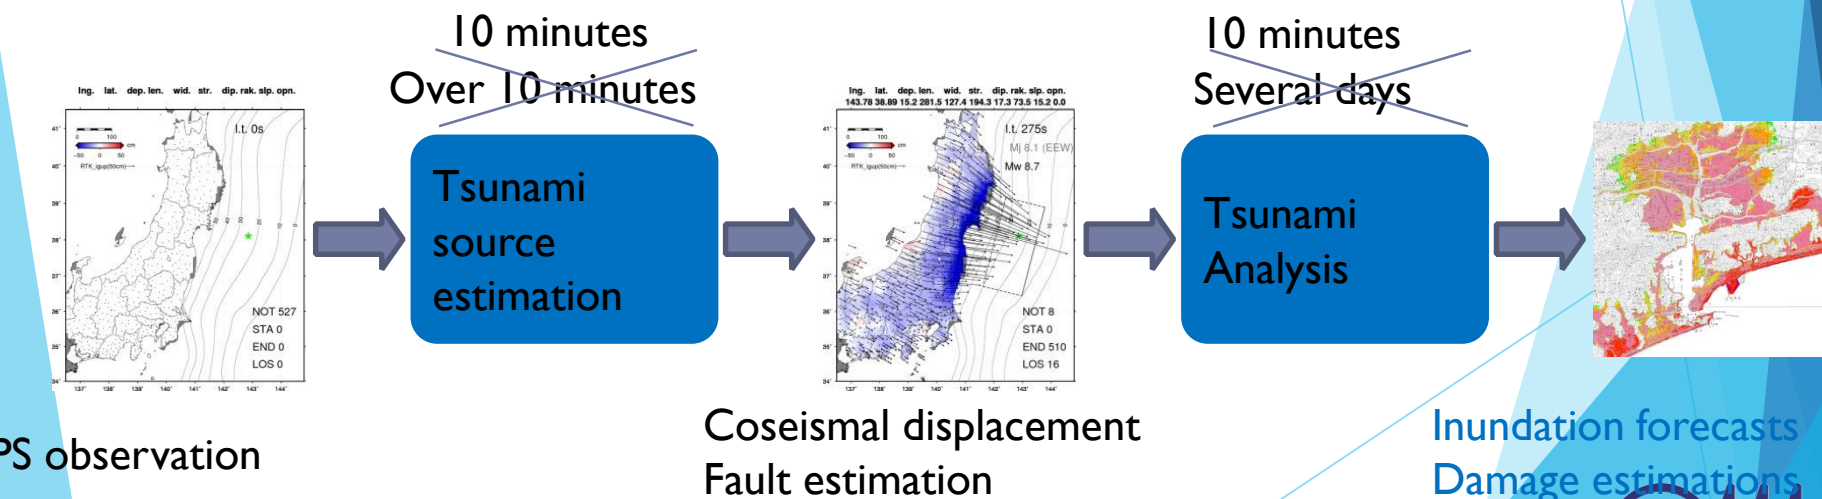

SEAIP2016, Dec. 7, 2016

Table of Contents

- ▶ Disaster Mitigation
- ▶ Visualization with SDN-NFV
- ▶ Access Control for SDN-NFV

Objective of Real-Time Tsunami Analysis

- ▶ Delivery of the inundation forecasts and damage estimations within **20 minutes** of an earthquake
 - ▶ Tsunami source estimation in 10 minutes
 - ▶ Tsunami analysis with 10 m grids in next 10 minutes
- 10 – 10 – 10 Challenge**

System Configuration

SX-ACE joins the system as soon as a large earthquake ($>M7$) occurs

Quake Information
GPS Obs. data

RAPiD System

RTK-GPS analysis

Fault model estimation

System Multiplexing

- ▶ Handling
 - ▶ Tohoku University
 - ▶ SX-ACE 2560 nodes
- ▶ Cooperate with
 - ▶ Osaka University
 - ▶ SX-ACE 1536 nodes
 - ▶ JAMSTEC
 - ▶ SX-ACE 5120 nodes
- ▶ Effects
 - ▶ Increasing disaster resistance
 - ▶ Load distribution
- ▶ First experiment
 - ▶ Jobs sharing between Sendai and Osaka

Products of Real-Time Tsunami Analysis

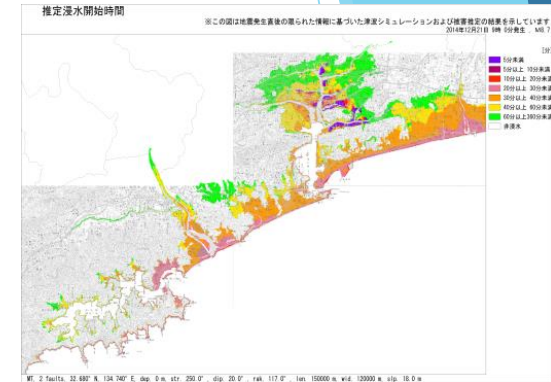

▶ Tsunami inundation forecasting

- ▶ Tsunami arrival time
- ▶ Tsunami inundation depth
- ▶ Tsunami inundation start time
- ▶ Tsunami level changes

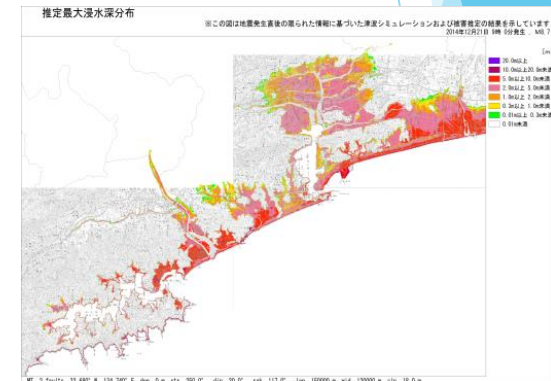

▶ Damage estimate

- ▶ Day time population
- ▶ Night time population
- ▶ Structural damage (houses)

▶ The products are delivered to local government

Estimated arrival time at Kochi city

Estimated inundation depth at Kochi city

Technical Issue : Transcoder for various devises

Visualization for e-Science : Tiled Display Wall

- ▶ **Tiled Display Wall (TDW)**
 - ▶ Ultra high resolution and scalable visualization system
 - ▶ Sharing environment for large scale visualization contents is needed to e-Science community.

TDW has been widely accepted and used for visualization of large-scale scientific data on HPC

[SC12/SC13]Network Failure Avoidance TDW using SDN and Buffering

Issue

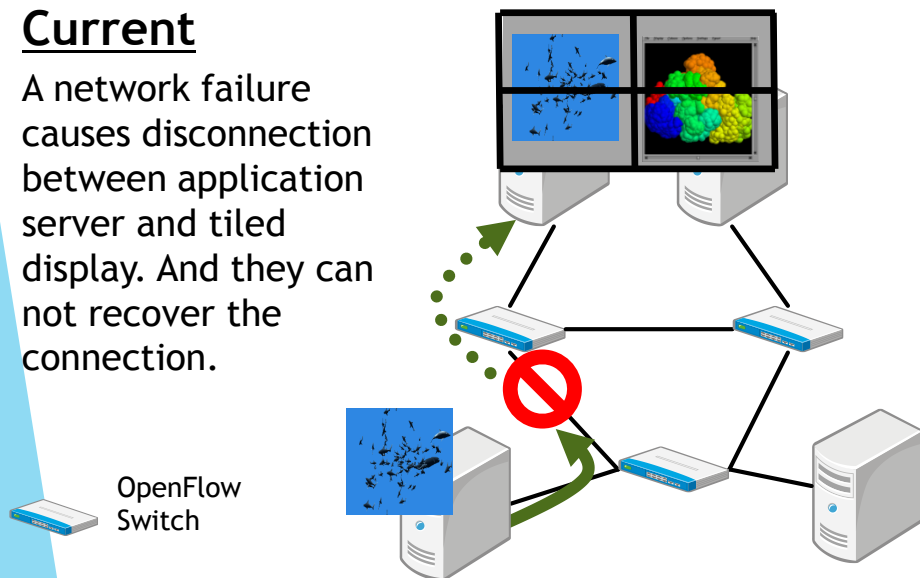

- ▶ **SAGE** depends heavily on a network streaming technique in its architecture, however does not have any recovery mechanism against cases of network problems

Result

- This research aims at realizing a **network failure avoidance functionality for SAGE**, focusing on OpenFlow against SAGE vulnerability to network failure.
- T. Furuichi, S. Date, H. Yamanaka, K. Ichikawa, H. Abe, H. Takemura, and E. Kawai, "A prototype of network failure avoidance functionality for SAGE using OpenFlow", *Proceedings of 2012 IEEE 36th International Conference on Computer Software and Applications Workshops*. pp.88-93, Jul. 2012.

Current

A network failure causes disconnection between application server and tiled display. And they can not recover the connection.

Propose

If our system meets a network failure, system behaves ;

- Finding another pathway on redundancy network
- Reconnecting between application server and tiled display

Flow and Connection Control

Finding network failure

Automatic recovering

[SC14] SAGE-based Tiled Display Wall Enhanced with Dynamic Routing Functionality Triggered by User Interaction

[Problem]

Network congestion causes decreasing visualization quality and frame rate.

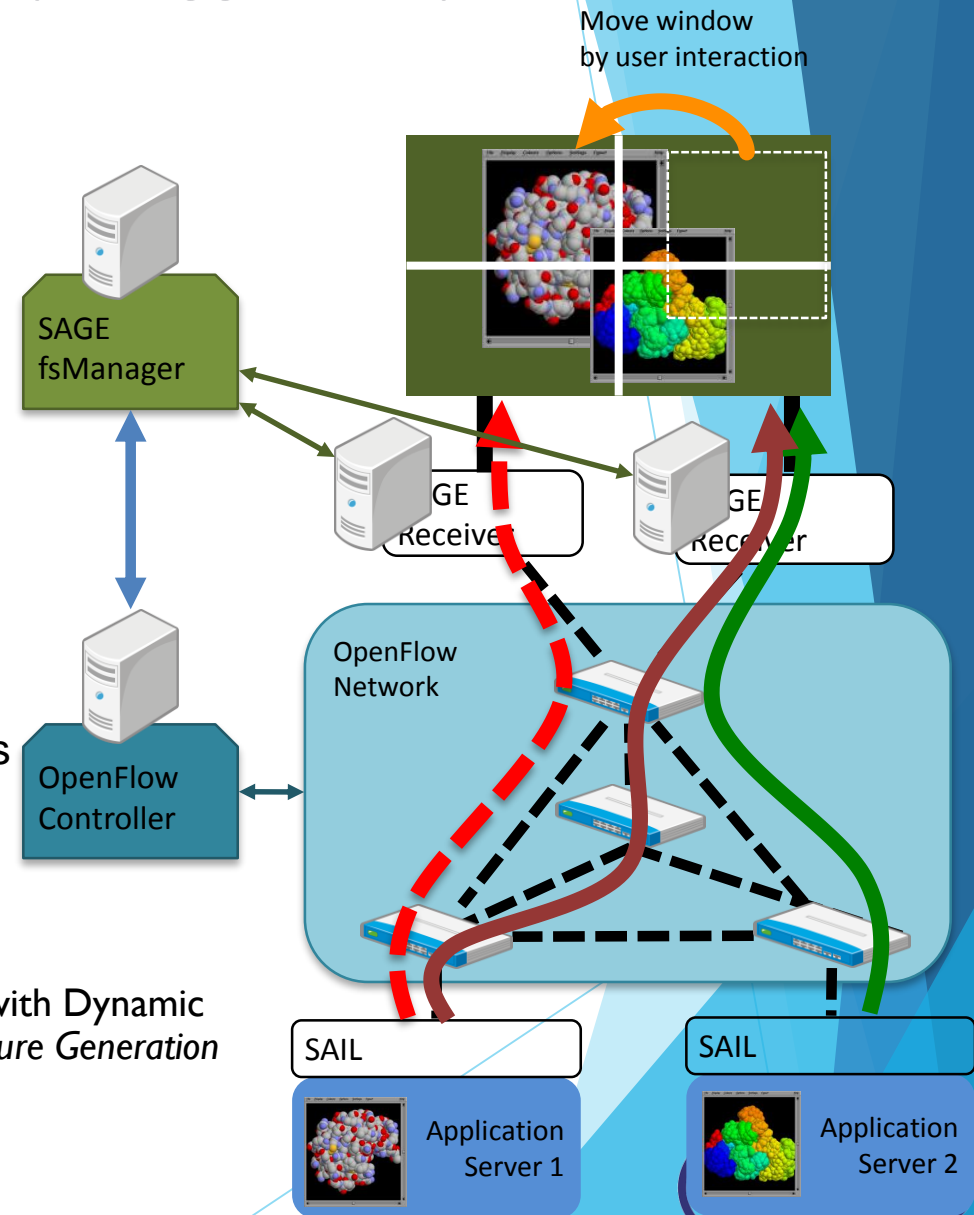

[Goal]

Dynamic flow control of multiple network streams from multiple sites for smooth user-interaction & visualization

[Approach]

We modified SAGE with OpenFlow controller as a software program that controls the whole network against network parameters resulted from user interaction.

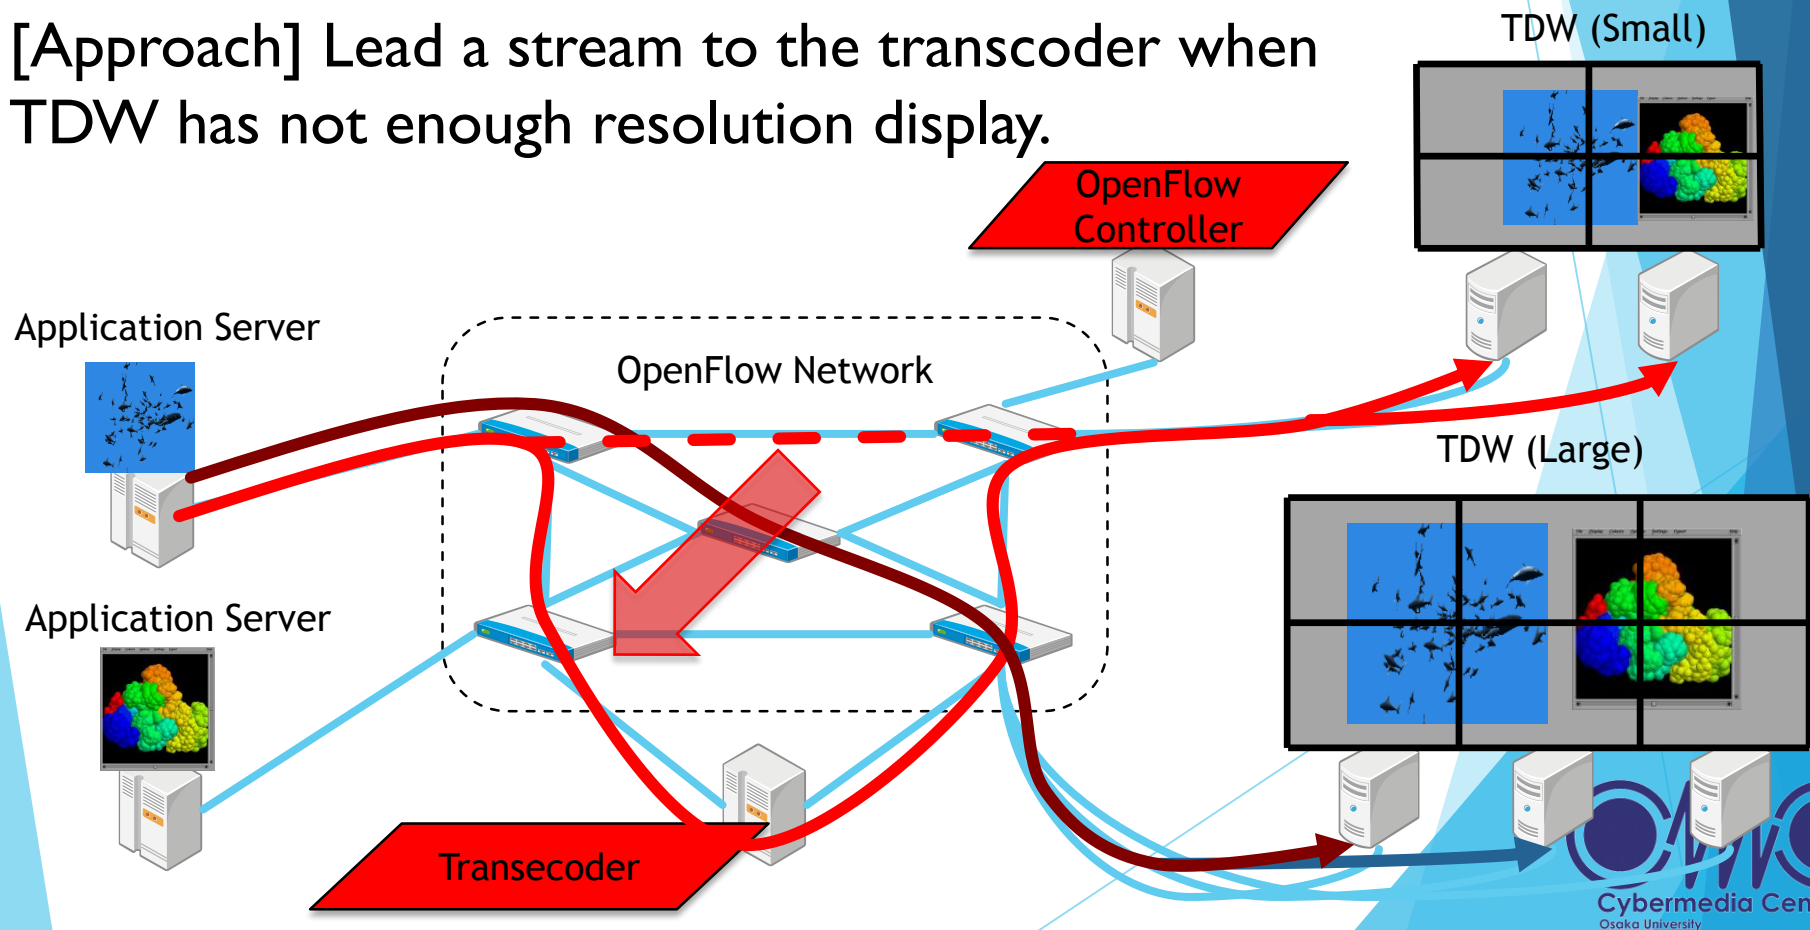

Y.Kido et.al., SAGE-based Tiled Display Wall Enhanced with Dynamic Routing Functionality Triggered by User Interaction, *Future Generation Computer Systems*, Vol. 56, pp.303-314, Mar. 2016

[SC15] Sharing Visualization Contents between TDWs

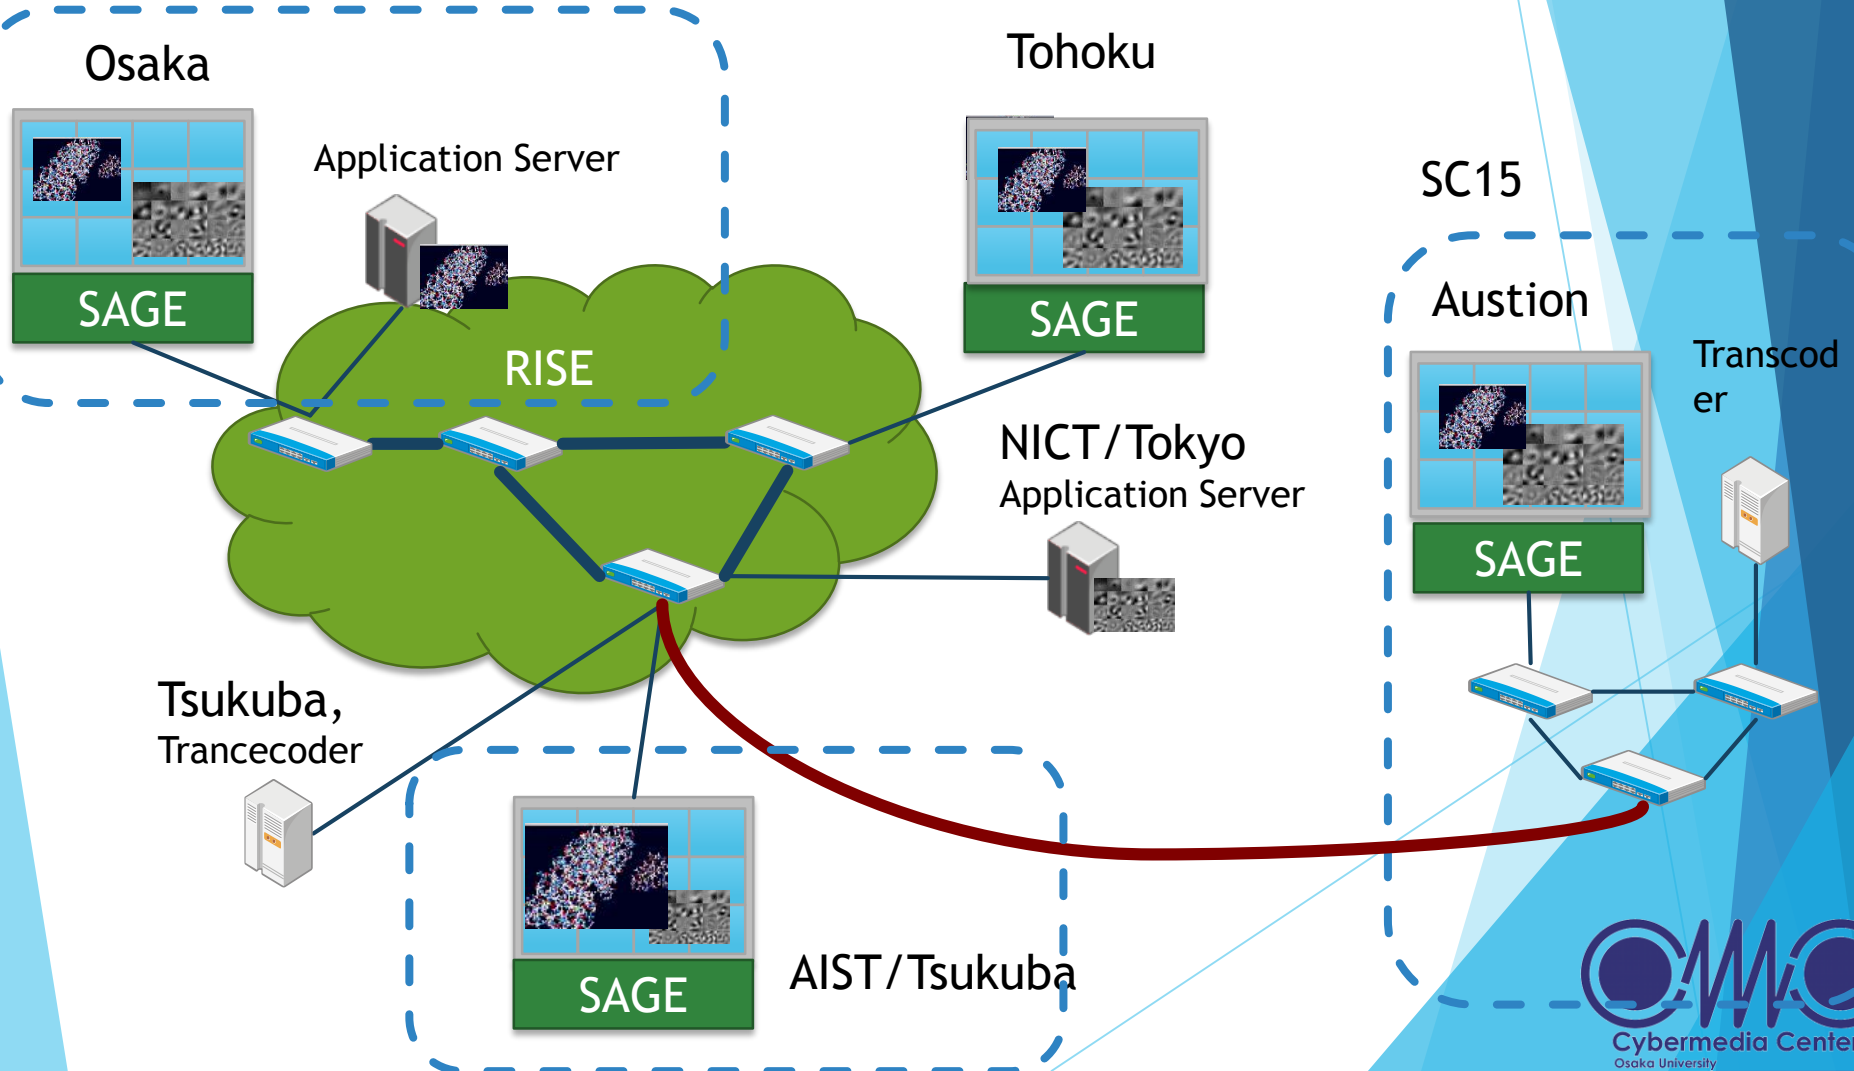

[Goal] Sharing visualization contents between each different resolution TDW

[Approach] Lead a stream to the transcoder when TDW has not enough resolution display.

SC15 Demonstration

The environment of Sharing visualization contents between each different resolution TDW

Toward SDN-NFV Infrastructure: Sci-VisCloud

- ▶ Sci-VisCloud : an automatically assignment mechanism of network slice with computational resources for each user

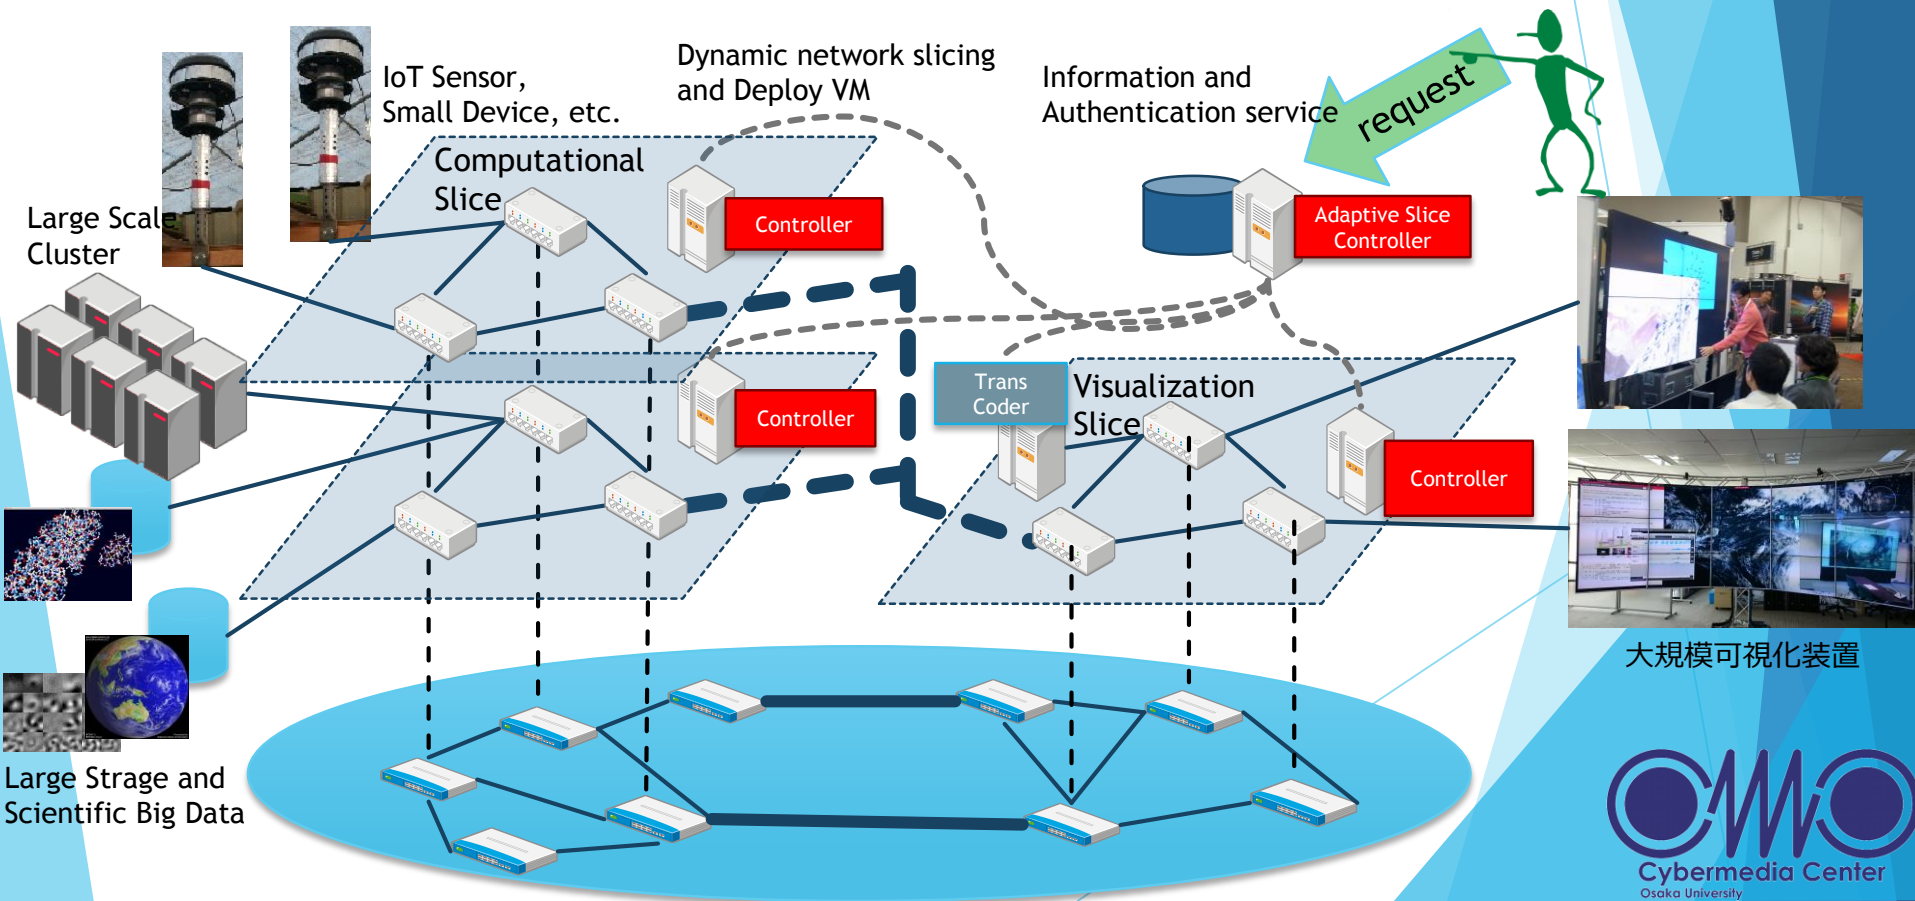

Table of Contents

- ▶ Disaster Mitigation
- ▶ Visualization with SDN-NFV
- ▶ Access Control for SDN-NFV

IoT + SDN ?

► What we can change IoT world if we can “program” network?

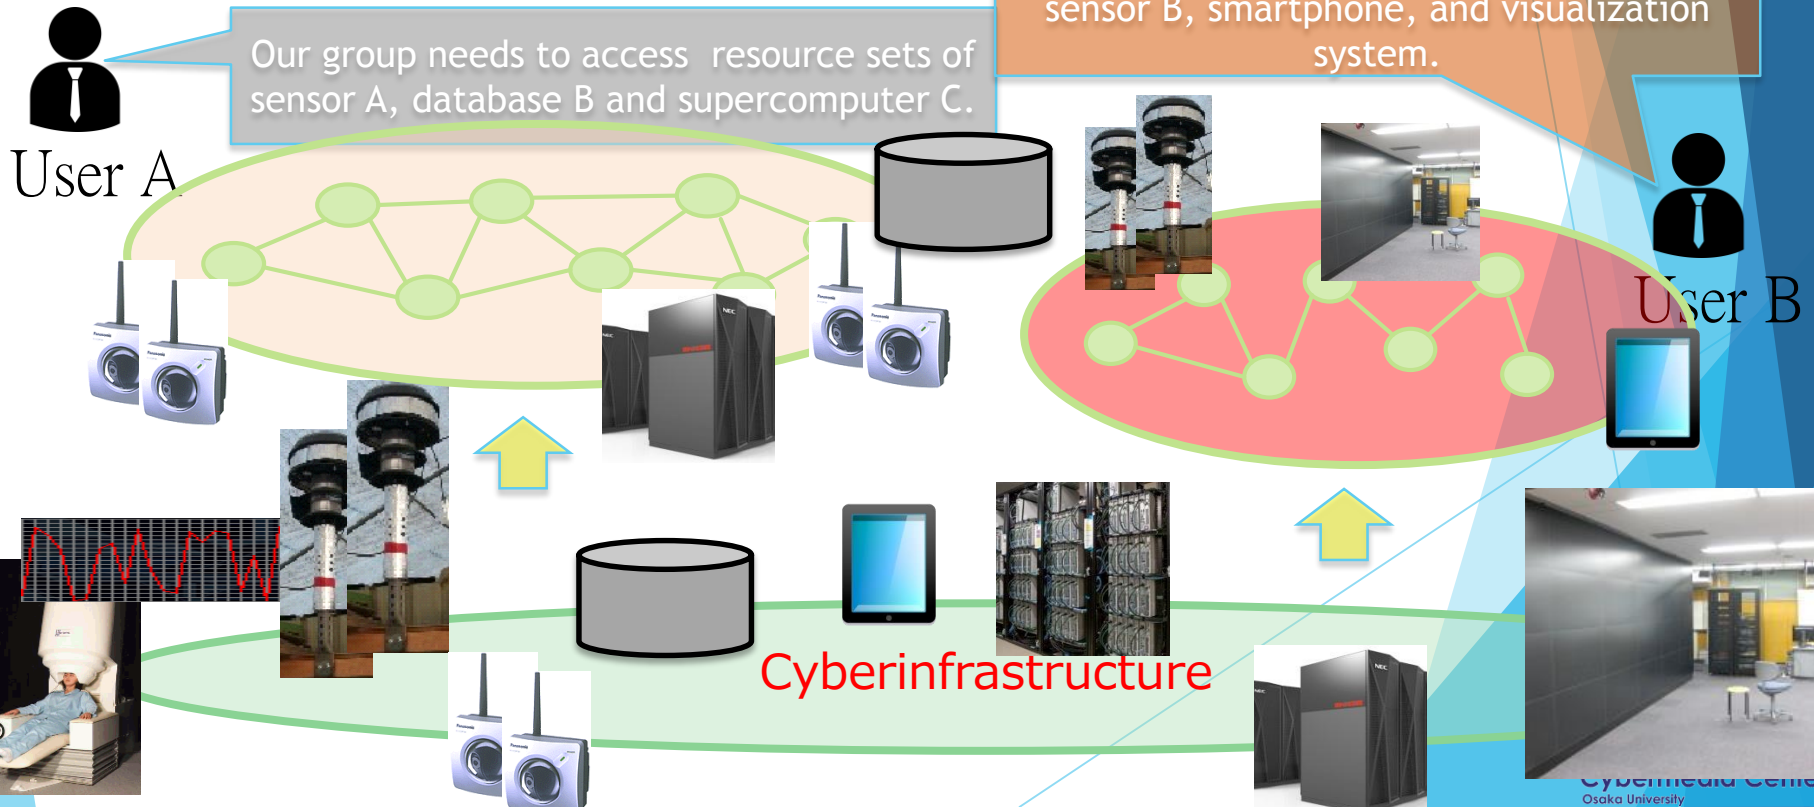

IoT: a diversity of resources(things) are connected onto a network and each of many parties shares a set of things.

➡ Each party has to be able to access resources, each of which has a different security attributes, with appropriate privilege.

Problem of Sharing v.s Exclusiveness

Our group needs to access resource sets of sensor B, smartphone, and visualization system.

Our group needs to access resource sets of sensor A, database B and supercomputer C.

Access-controlled networking mechanism

- ▶ We propose **an access-controlled networking mechanism** that provides user-dedicated infrastructure.
- ▶ We have adopted **RBAC** (Role Based Access Control) and **SDN** (Software Defined Networking) to develop the mechanism.
- ▶ RBAC is a concept of access control that is conducted through *roles*. All users receive permissions only through the *role*. Only changing a role of a user, permissions of the user can be changed.

- ▶ SDN allows us to program and control network resources.

FlowSieve

FlowSieve is a preliminary implementation of the networking mechanism.

- ▶ FlowSieve is implemented as **an OpenFlow controller program**.
- ▶ FlowSieve has a security policy file that contains
 - ▶ Roles information
 - ▶ Users information

Summary

▶ Disaster Mitigation

- ▶ Tohoku Univ. and Osaka Univ. have been constructed a Disaster mitigation system using supercomputer systems.

▶ Visualization with SDN-NFV

- ▶ We have been developed and modified SAGE with OpenFlow.
- ▶ <http://hpc-sdn.ime.cmc.osaka-u.ac.jp>

▶ Access Control for SDN-NFV

- ▶ FlowSieve is a preliminary implementation of the networking and access control mechanism.
